

“the principle of sustainability and energy efficiency was uppermost in their mind”

cladding without paying closer attention to greater insulation and air tightness required to make their home warm and energy efficient.”

This 232sqm home fully embraces the principles it embodies as it continues to inspire and inform LiteGreen’s many other clients. The company is also part of the Superhome Movement which is focussed on raising standards in the New Zealand building industry. Builds like these are being featured this June in the Canterbury’s annual Superhome Exemplar Tour: “As more people start living in these energy efficient houses and realise

how much better they are to live in, then demand for them will continue to grow.”

The Pegasus home achieves a minimum HomeStar 6 design rating – a now industry recognised rating that is classed as being 4 times superior than the standard building code with surprisingly minimal extra cost.

If you are looking to build an energy efficient, warm, healthy home in the future then please don’t hesitate to get in touch with the team at LiteGreen.
